

ARDUINO DI GIOSIA

Engineering Leader · Senior Engineer

me@erme2.com | github.com/erme2 | linkedin.com/in/arduinodigiosia | Nottingham, UK

PROFESSIONAL SUMMARY

Engineering leader who takes products from proof-of-concept to production-grade. Most recently VP of Engineering at ClickTech, where in six months I rebuilt four remote engineering teams, eliminated production outages, delivered a central payments and subscriptions platform, scaled products to multi-region, and restored delivery predictability through rebuilt CI/CD and an agile cadence. Backed by 20+ years of hands-on engineering across TypeScript, Node.js, NestJS, React, and PHP, six years leading teams behind a 5-10M clicks/week affiliate platform at Moreniche, and regulated financial services experience at AJ Bell. Fluent in AI-assisted delivery, with a disciplined approach built around method, human review, and accountability as prerequisites, not afterthoughts.

CORE SKILLS

Leadership: engineering turnarounds, technical direction, team building and mentoring across time zones, hiring, delivery planning, stakeholder and executive communication, acting-CTO scope

Backend: TypeScript, Node.js, NestJS, REST API design, payments and subscription systems, integrations, background processing, PHP (Laravel, Symfony)

Frontend: React, Vue, TypeScript, JavaScript

Cloud & infrastructure: AWS (incl. EKS), Vercel, Railway, Docker, Kubernetes, Linux, Bash, SQL and NoSQL databases, CI/CD

AI-assisted delivery: governance of coding-agent workflows (Codex, Claude Code, Cursor, Copilot, Gemini CLI): guardrails, templates, review gates, agent workflow design

EXPERIENCE

VP of Engineering | ClickTech

Nottingham, UK (remote) · Nov 2025 – Aug 2026

- Hired as VP of Engineering to stabilise and industrialise a portfolio of commercially successful products originally built as proofs of concept; carried acting-CTO scope day to day — one-to-ones, product and finance meetings, and ownership of all technical decisions — with the CTO setting high-level direction only.
- Rebuilt the engineering organisation into four teams (billing, funnels, hub, devops/omni): 10–12 engineers, fully remote across four time zones.
- Eliminated production outages within ~3 weeks of joining, then eliminated release regressions over the following quarter by hiring a test specialist, adding end-to-end testing on top of existing TDD, and upskilling the team — releases became routine and the rollback path went effectively unused.
- Led the rebuild of a central payments and subscriptions platform (NestJS REST API): a single source of truth for payments, products, and subscriptions, with unified webhooks, endpoints, and a shared client library across all products, plus structured payment-error handling that recovered fixable failures and improved conversion.
- Scaled products to multi-region, frontend and backend, across Vercel, Railway, and AWS EKS; migrated legacy PHP to React frontends and NestJS/TypeScript backends.
- Rebuilt CI/CD and reintroduced an agile sprint cadence, restoring delivery predictability and enabling product to prioritise with confidence; KPI targets met for consecutive months.
- Introduced product analytics (PostHog) across the estate — platform now tracking ~3M events/month.
- Partnered with the incoming CTO to standardise AI-assisted development with coding agents including Codex and Claude Code: guardrails, templates, and review gates that made small delivery tasks safely available to product managers; co-authored the company's internal engineering standards for AI-assisted delivery.

Engineer III | AJ Bell

Manchester, UK (hybrid) · Mar 2023 – Oct 2025

- Maintained and developed the main customer-facing investment platform website across frontend and backend services, including TypeScript/JavaScript application work.
- Built and improved REST APIs, third-party integrations, and supporting services with a focus on reliability and maintainability, balancing new development with production support.
- Worked within a security- and stability-first engineering culture in regulated financial services, deepening rigorous practices around review, testing, and change control — discipline later applied to governing AI-assisted delivery at ClickTech.

Head of Development | Moreniche

Nottingham, UK · Mar 2017 – Mar 2023

- Set technical direction for the company's core systems — affiliate interface, REST/API platform, and tracking servers — leading four teams (tracking, shops, devops, design) of 10–15 engineers.

- Scaled the tracking platform from ~1M to 5–10M clicks/week at marketing peak, supporting \$2–5M/year in affiliate revenue, while improving reliability and operational control of high-traffic tracking and reporting workflows.
- Mentored and supported the development team while staying close to architecture and implementation; worked directly with business stakeholders to shape priorities and resolve technical risk.

SELECTED PERSONAL PROJECTS

Private repositories — code access available on request.

Yaup | AI agent governance tooling (PHP)

2026

- Workflow tooling applying one versioned policy and a mechanically enforced planning gate across Codex, Claude Code, Cursor, GitHub Copilot, and Gemini CLI: discovery, structured rules, read-only planning, human approval, Git-backed execution, validation, and auditable project records. Repository: <https://github.com/erme2/Yaup>.

Pane | Data-access control plane (PHP/Laravel)

2026

- Independently installable control plane for authentication, organisation isolation, authorisation, encrypted database connections, catalog discovery, and controlled CRUD, with versioned API contracts, static analysis, and documented operational boundaries. Repository: <https://github.com/erme2/Pane>. Demo: <https://pane.erme2.com>.

Latte | Frontend template (React/TypeScript)

2026

- Reusable React/TypeScript template for organisation-specific applications powered by Pane: shared authentication, Pane API integration, Docker-based local development, and a package/template model for derived applications. Repository: <https://github.com/erme2/Latte>.

EARLIER EXPERIENCE

Lead Developer, Moreniche — Nottingham, UK (Mar 2016 – Mar 2017): built and managed the affiliate network development team; maintained affiliate interfaces, backend services, and tracking systems.

Senior Developer, DVO Media (2015–2016) and PHP Developer, Twist (2015) — Nottingham, UK: affiliate network, integration, tracking, and production support work.

Head of Development, STI Company — Ascoli Piceno, Italy (2013–2014); Lead Developer, Arte — Ravenna, Italy (2010–2012); Freelance Software Developer — Italy (2002–2012).

EDUCATION

Multi-Language Developer — Computer Programming, EQF Level 3 | Scuola Regionale Marche, San Benedetto del Tronto, Italy | 1999

Maturità Classica | Liceo Classico Melchiorre Delfico, Teramo, Italy | 1994

ADDITIONAL INFORMATION

Italian software engineer based in Nottingham.
